10.1 Activity – Theoretical and Empirical Probability Name:

<u>Pa</u>	rt 1	– Compa	ring The	eoretical	and Em	pirical P	robabili	<u>ties</u>			
Yc	u w	ill receive	one die	to roll an	d one per	nny to tos	ss. Follov	v the dire	ections be	elow:	
1.	. Calculate the theoretical probability for a coin to land on heads or tails, respectively.										
	a. What is the theoretical probability of flipping heads (H)? Tails (T)?										
		H: T:									
	b.	o. Is this a classical or empirical probability? Why									
	c.	c. Out of the 10 tosses, how often do you expect to get heads? Tails?									
H: T:											
2.	To	ss the coir	n 10 time	s. After e	ach toss,	record if	f you got	heads or	tails in th	ne table.	
		Calculate	2 tl2 2 mm le	ability o	f anala av	ant hasa	1 040 270174	data			
	a. Calculate the probability of each event based on your data.										
	H: T:										
	b.	o. Is this a classical or empirical probability? Why									
c. Do your results match your expectations from #1c?											
3. Compare your results from #2a to other members in your group.a. Are the results the same? Should you expect the same results? Why or why not?											
								Why or	why not?		
4. Combine your results from the coin flips in #2 with your group members.											
4.	Co	mome you	ur resums	from the	com mp	08 III #2 W	illi your	group m	embers.		
	a.	Calculate	e the over	all proba	bility of		d tails usi	ing all m	embers' 1	results.	
		H:				T:					
	b.	How are they different from the previous results of your 10 coin tosses (#2a)?									

c. Does your experimental probability (#4a) match your theoretical probability (#1a)?

5. Calculate the theoretical probability for rolling each number a. What is the theoretical probability for each number?						er on a six-sid	ed die.			
		1:	2:	3:	4:	5:	6:			
	b.	Out of th	Out of the 10 rolls, how often do you expect to get each number? 1: 4: 5: 6:							
		1:	2:	3:	4:	5:	6:			
6.	Та	ike the die	and roll it 10) times. After each	h roll, record w	hich number y	ou got in the ta	ıble.		
	a.	After 10	rolls, write y	our results in frac	tion or decimal	form, as you	did for #2a.	able.		
		1:	2:	3:	4:	5:	6:			
	b.	1: 2: 3: 4: 5: 6: Compare your results with your predictions in #5b. How close are they?								
7	a		1, 0	WC	1					
/.	Co	mpare you	e your results from #6a to other members in your group. the results the same? Should you expect the same results? Why or why not?							
	a. Are the results the same? Should you expect the same results? Why or why not?									
8. Combine your results from the die rolls with your group members.a. Calculate the overall probability of each number using all members' results.										
		1:	2:	3:	4:	5:	6:			
	a. How are they different from your previous result for the 10 die rolls in #6?									
	b.	Does your experimental probability match your theoretical probability?								

9. Compare the theoretical calculated probability numbers with your actual data for both activities (coin and dice). What do your combined results tell you about theoretical versus empirical probability?

Part 2 – Sample Space and Probability

Colors	Red	Orange	Yellow	Green	Brown	Total
Quantity	75	84	55	62	91	
Probability						

- 10. Fill in the table then answer the following questions:
 - a. If you draw one M&M, what is the probability that it is yellow?
 - b. If you draw one M&M, what is the probability that it is not yellow?

- c. If you draw one M&M, what is the probability that it is orange or brown?
- d. If you draw one M&M, what is the probability that it is orange and brown?
- e. If you draw one M&M, what is the probability that it is neither green nor brown?
